

Design. Build. Maintain. Connect.

#### Seeing the Bigger Picture: Model Exploration and Scoping with Advanced SSI Tools

Danielle Pinksen – Training Coordinator, SSI

# Challenge

#### CHALLENGE -

How do you efficiently scope and validate a change that needs to be made?

#### SOLUTION -

Use new tools like Portal, WorkView, PartViews and PublisherLT to easily visualize and fully understand the change.

# Scoping the Change

- Scoping a change will usually begin with the latest released configuration.
- ShipbuildingPLM is a great place to start:
  - Parts being changed are easily visualized and reviewed.
  - Functional design information is quickly accessed.
    - Additional items can be referenced as needed.
  - Without ShipbuildingPLM
     you would still start with the latest released configuration.

# Scoping the Change

- Traditionally when scoping a change, designers typically go back to Navisworks, hope it's current, and:
  - Find the part(s) to be changed.
  - Fly around looking at all parts in the area.
  - Start selecting parts to get part names, drawing names, assembly names, etc.
    - Make a list of everything that needs to be touched with the change.
  - All of which is very time consuming and leaves room for mistakes, missed items, rework, etc.

# Scoping the Change with Portal

🙆 Por

321-5

321-57

- Portal is a new one stop shop that lets you:
  - Quickly search a project
     for items.
  - Use shortcuts to the item's Part Revision history, UDA Editor & ShipbuildingPLM data.
    - Easily review the data associated with the item.
      - Use live links to the drawing, assemblies and compartment containing the item and to the item itself.

#### But What Other Parts Are Here

- Portal and PartViews make it easy to answer this question:
  - Want to see what's around the part?
     Use the part Name link & then load
     PartViews by Selected Extents.
    - Want to see what else is in the same assembly?
      - Use the Assemblies links & then Load PartViews.
    - Want to see what else is in the same compartment? Use the Compartment link & then Load PartViews.

# Using WorkViews to Identify Parts

 Only want to see some of the parts in a Compartment or Assembly? Create a WorkView & use it to load PartViews.

WorkView boundaries can be adjusted on the fly, as you work, to easily show different regions of space.

Simply delete the PartViews that are not needed.

# Using WorkViews to Identify Parts

- With WorkView we discovered a problem with other parts in a different system impacting a foundation that had been missed before.
  - What system are they in?
  - Can we quickly and easily get a list of the parts involved? Portal can help with both questions.

#### Generating a Parts List

- Use the Parts and/or
   PartViews to identify and then select the parts
   involved in the change.
- Load the selected parts and/or PartViews

involved in the change

into Portal.

#### Generating a Parts List

Export the list of parts
 directly from Portal to a
 TSV file for future use.
